Understanding interactions and mechanisms using Moderation and Mediation Analysis

Jarlath Quinn

FAQ's

- Is this session being recorded? Yes
- Can I get a copy of the slides? Yes, we'll email links to download materials after the session has ended.
- Can we arrange a re-run for colleagues? Yes, just ask us.
- How can I ask questions? All lines are muted so please use the chat panel – if we run out of time we will follow up with you.

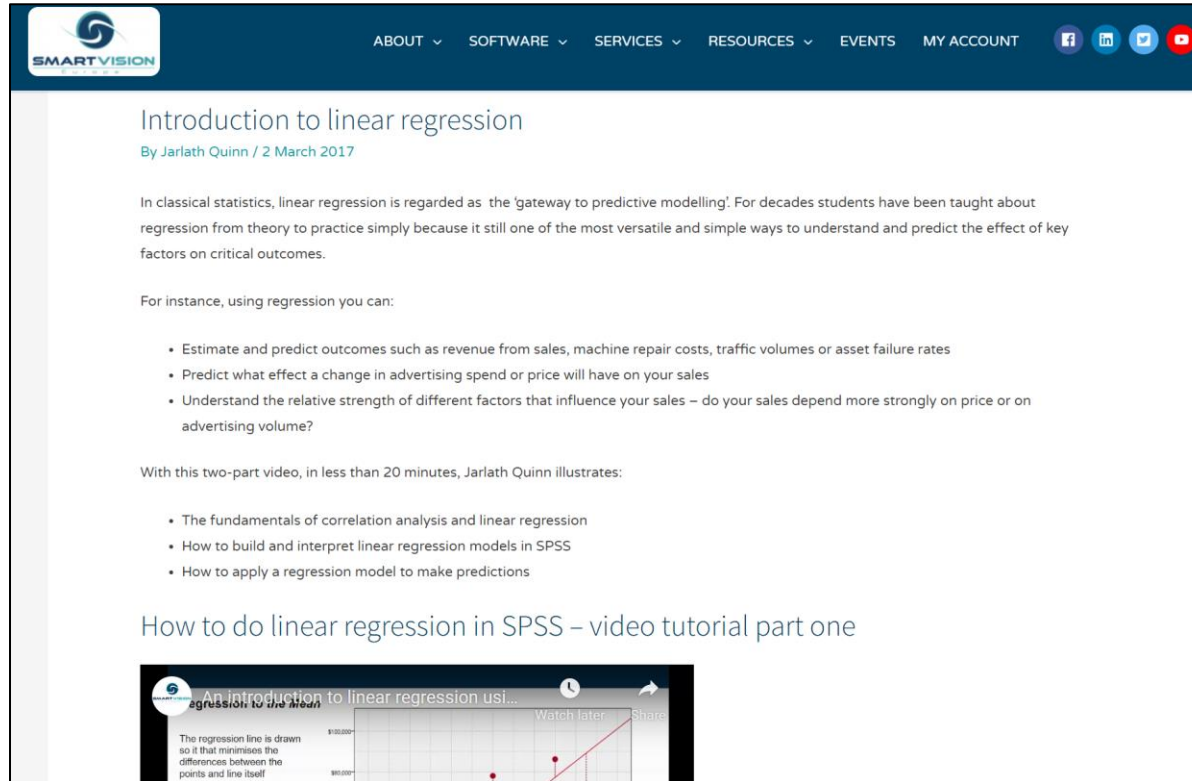

- Gold accredited partner to IBM, Predictive Solutions and DataRobot specialising in advanced analytics & AI technologies
- Work with open-source technologies (R, Python etc.)
- Team each has 15 to 30+ years of experience working in the advanced and predictive analytics industry
- Deep experience of applied advanced analytics applications across sectors
 - Retail
 - Healthcare/Pharma
 - Finance/Insurance
 - Media/Telecoms
 - Utilities
 - FMCG
 - Charity/Housing/Government

Prerequisites to this webinar: Understanding Linear Regression

- <https://www.sv-europe.com/blog/introduction-to-linear-regression/>

Introduction to linear regression
By Jarlath Quinn / 2 March 2017

In classical statistics, linear regression is regarded as the 'gateway to predictive modelling'. For decades students have been taught about regression from theory to practice simply because it still one of the most versatile and simple ways to understand and predict the effect of key factors on critical outcomes.

For instance, using regression you can:

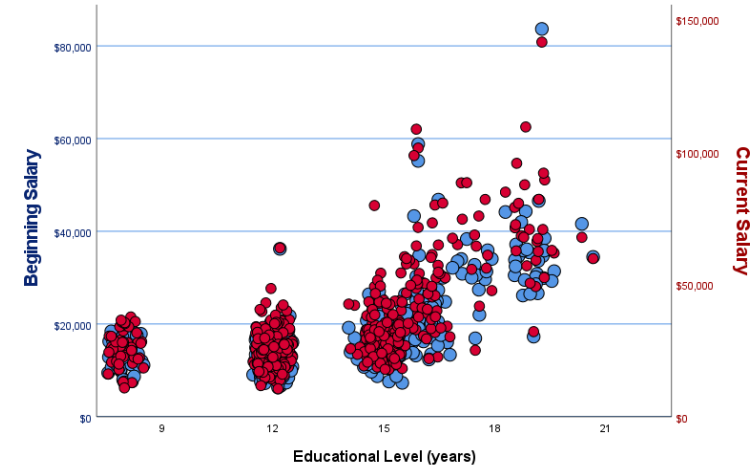

- Estimate and predict outcomes such as revenue from sales, machine repair costs, traffic volumes or asset failure rates
- Predict what effect a change in advertising spend or price will have on your sales
- Understand the relative strength of different factors that influence your sales – do your sales depend more strongly on price or on advertising volume?

With this two-part video, in less than 20 minutes, Jarlath Quinn illustrates:

- The fundamentals of correlation analysis and linear regression
- How to build and interpret linear regression models in SPSS
- How to apply a regression model to make predictions

How to do linear regression in SPSS – video tutorial part one

The regression line is drawn so it that minimises the differences between the points and line itself

Moderation and Mediation Analysis

Why are Moderation and Mediation analyses useful?

- In multiple linear regression we are often concerned with questions like “Does X predict Y after controlling for other variables?”
- In such situations, the coefficients tell you the *average effect* of each predictor holding others constant.
- Moderation and Mediation analysis drive **deeper** insights: allowing to you to find out *when* something is related (moderation) and *how* it is related (mediation).
- **Moderation** analysis is usually multiple linear regression including an **interaction** term.
- **Mediation** analysis is akin to multiple linear regression done in steps to test a *pathway* ($X \rightarrow M \rightarrow Y$)

PROCESS is an observed variable OLS and logistic regression path analysis modeling tool. It is widely used through the social, business, and health sciences for estimating direct and indirect effects in single and multiple mediator models (parallel and serial), two and three way interactions in moderation models along with simple slopes and regions of significance for probing interactions, and conditional indirect effects in moderated mediation models with a single or multiple mediators or moderators. The use of PROCESS is described and documented in *Introduction to Mediation, Moderation, and Conditional Process Analysis*, published by The Guilford Press. PROCESS was written by Andrew F. Hayes.

Installing Moderation and Mediation Analysis for IBM SPSS Statistics

Installing Moderation and Mediation Analysis in IBM SPSS Statistics

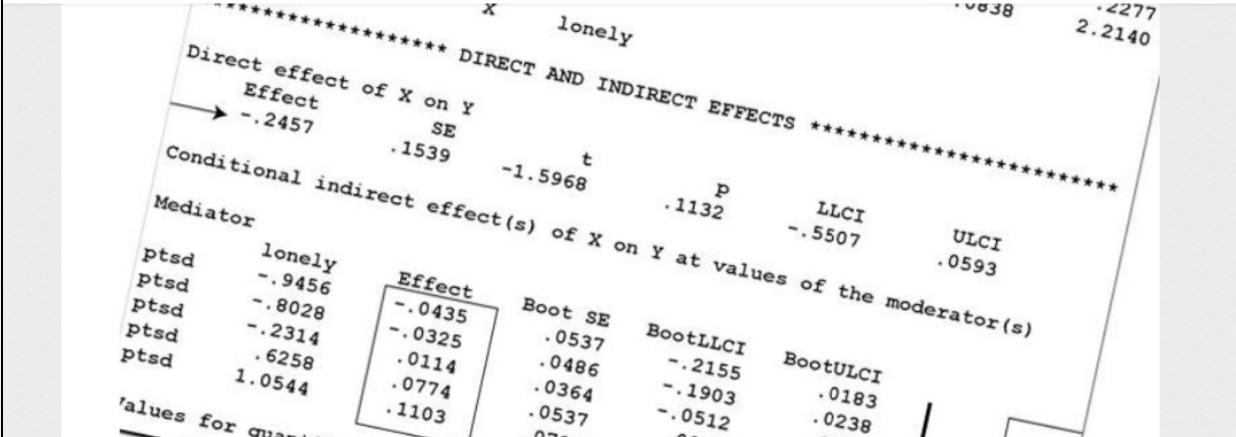

- Moderation and Mediation Analysis is NOT available as standard functionality in SPSS Statistics.
- Fortunately, it *is* available as a free downloadable package developed by Andrew F. Hayes Ph.D.
- Dr Hayes, created a package for SPSS (and other statistical software) called PROCESS, and includes instructions on how install the software which can be found here:
- <http://www.processmacro.org/>

The processmacro.org website

The PROCESS macro for SPSS, SAS, and R

PROCESS is a regression-based modeling tool. It is widely used through the social, business, and health sciences for estimating direct and indirect effects in single and multiple mediator models (parallel and serial), two and three way interactions in moderation models along with simple slopes and regions of significance for probing interactions, and conditional indirect effects in moderated mediation models with a single or multiple mediators or moderators. New features for ordinary regression analysis as [dealing with random measurement error in](#)

Computational Tools and Aids

PROCESS macro for SPSS, SAS, and R

PROCESS is a computational tool invented by CCRAM expert Andrew F. Hayes. It is freely-available for SPSS, SAS, and R, and has become widely used throughout the behavioral sciences as well as in business research, medicine, and public health for easing the estimation of effects in mediation, moderation, and conditional process analysis.

Version 5.0 is now available! The SPSS version of PROCESS v5.0 requires SPSS version 26 or later. The SPSS GUI for PROCESS v5.0 is now an extensions file (*.spe) rather than a custom dialog builder file (.spv).

Take a class on the use of PROCESS

Download PROCESS v5.0

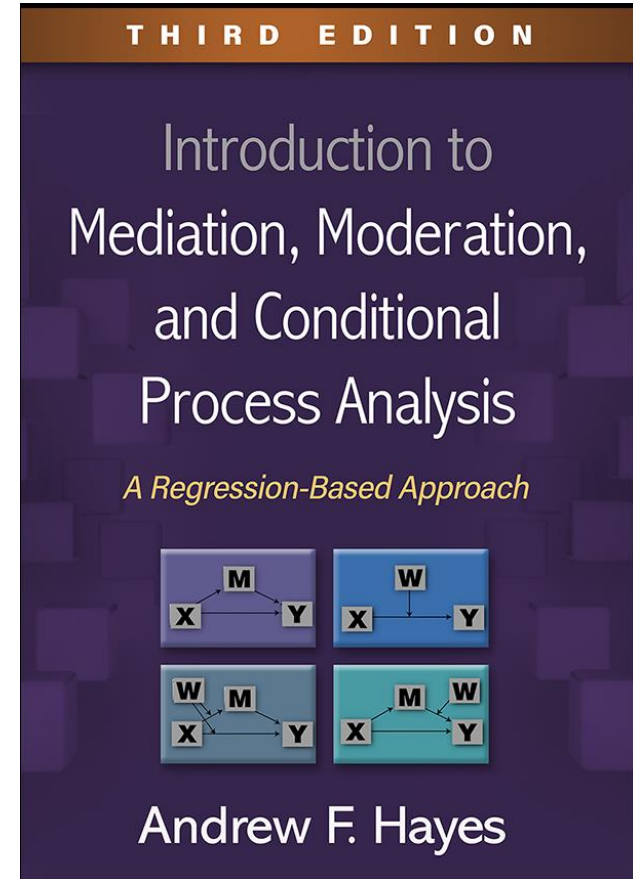

Steps to install the PROCESS dialog

1. Download the **Process** zip file (<http://www.processmacro.org>)
2. Unzip the file in a location of your choice
3. Start SPSS in **Run as Administrator** mode (right-click the icon)
4. Within SPSS, go to
 - **Extensions > Utilities > Install Custom Dialog**
5. To use the new procedure, navigate to
 - **Analyze > Regression > PROCESS**

Recommended Reading

- Andrew F. Hayes illustrates each step in an analysis using diverse examples from published studies, and displays SPSS, SAS, and R code for each example.
- Procedures are outlined for estimating and interpreting direct, indirect, and conditional effects; probing and visualizing interactions; testing hypotheses about the moderation of mechanisms; and reporting different types of analyses.
- Readers gain an understanding of the link between statistics and causality, as well as what the data are telling them.

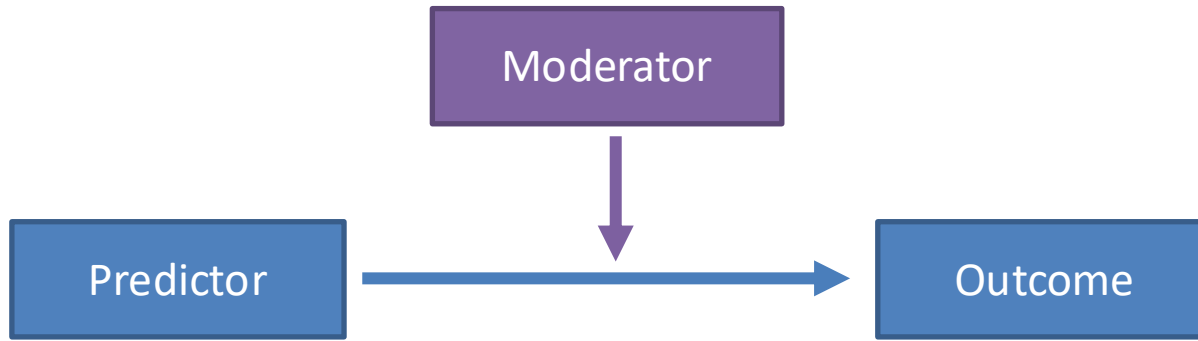

Understanding Moderation Analysis

Moderation Analysis

- A moderating variable is one that interacts with a key independent variable to **amplify** or **dampen** the relationship between the independent and dependent variables
- A moderator variable *contextualises* an effect by changing the relationship between an independent variable and a dependent variable. Moderating effects are also referred to as interaction terms.
- A moderator **is not caused** by an independent variable
- Examples:
 - Does time in employment affect salary progression? Is this relationship moderated by gender?
 - Does study amount affect your essay score? Is this moderated by sleep quality?
 - Does advertising spend affect sales? Is this relationship different by quarter?

Moderation Analysis - Graphical Form

Moderation Analysis - Statistical Form

- Y – Dependent Variable
- X – Independent Variable
- M – Moderator Variable
- X*M – Interaction between independent and moderator variable

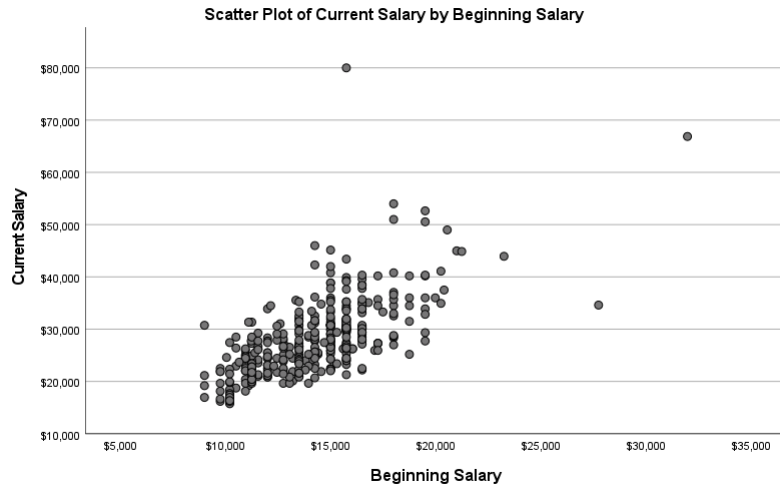

Dependent	Constant		Independent		Moderator		Interaction
Y	$=$	b_0	$+$	b_1X	$+$	b_2M	$+ b_3XM$

Performing Moderation Analysis in SPSS Statistics

Moderation Analysis

In the SPSS sample data file, **Employee data.sav**, there seems to be a strong relationship between starting salary and current salary

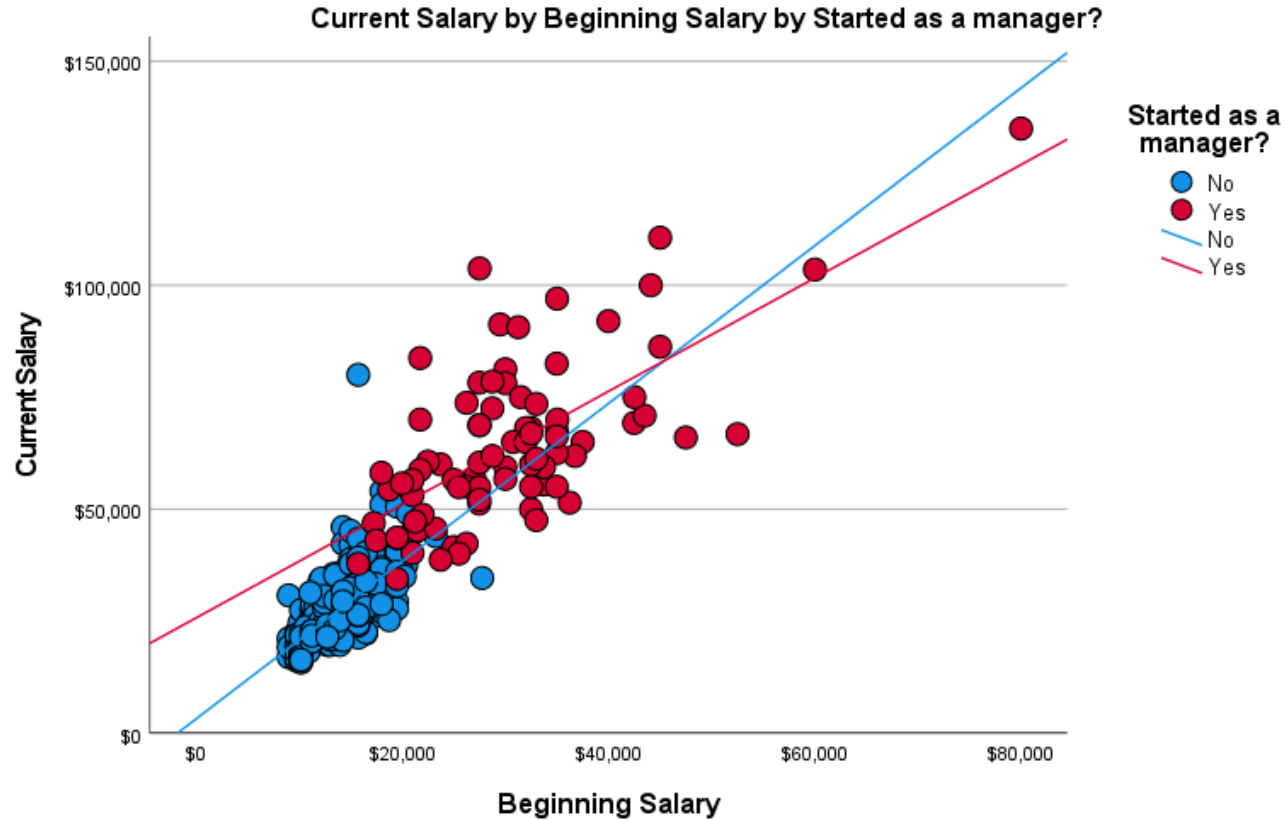

Report

Current Salary

Started as a manager?	Mean	N	Std. Deviation
No	\$28,053.18	390	\$7,363.358
Yes	\$63,977.80	84	\$18,244.776
Total	\$34,419.57	474	\$17,075.661

Is this relationship moderated by whether the employees started as managers or not?

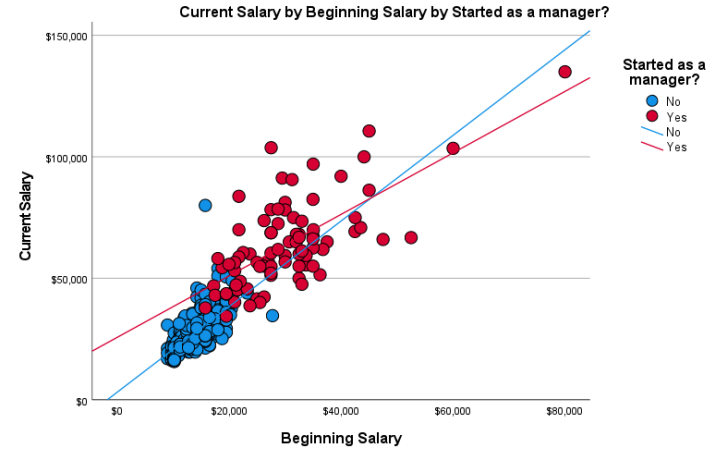

Moderation Analysis

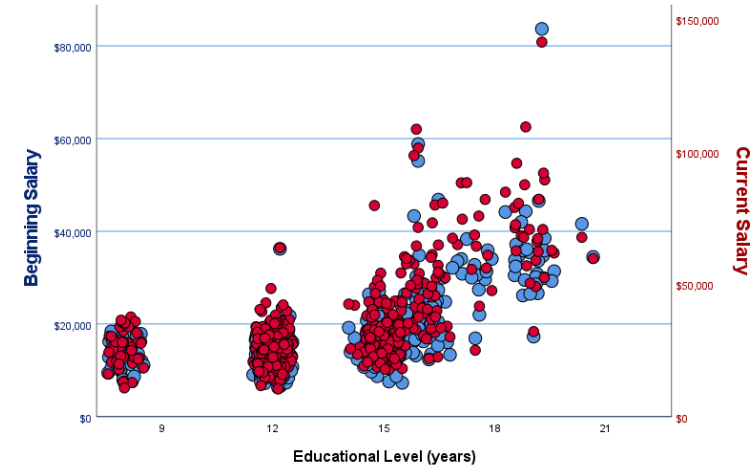

Moderation Analysis - Statistical Form

- **Current Salary** (Dependent Variable)
- **Beginning Salary** (Independent Variable)
- **Started as a manager** (Moderator Variable)
- **Beginning Salary* Started as a manager** (Interaction between independent and moderator variable)

$$\begin{array}{ccccccc} \text{Dependent} & & \text{Constant} & & \text{Independent} & & \text{Moderator} & & \text{Interaction} \\ \text{Current Salary} = & b_0 & + & b_1 & \text{Beginning Salary} & + & b_2 & \text{Started as a manager} & + & b_3 & \text{Beginning Salary} * \text{manager} \end{array}$$

Let's take a look...

Understanding Mediation Analysis

Mediation Analysis

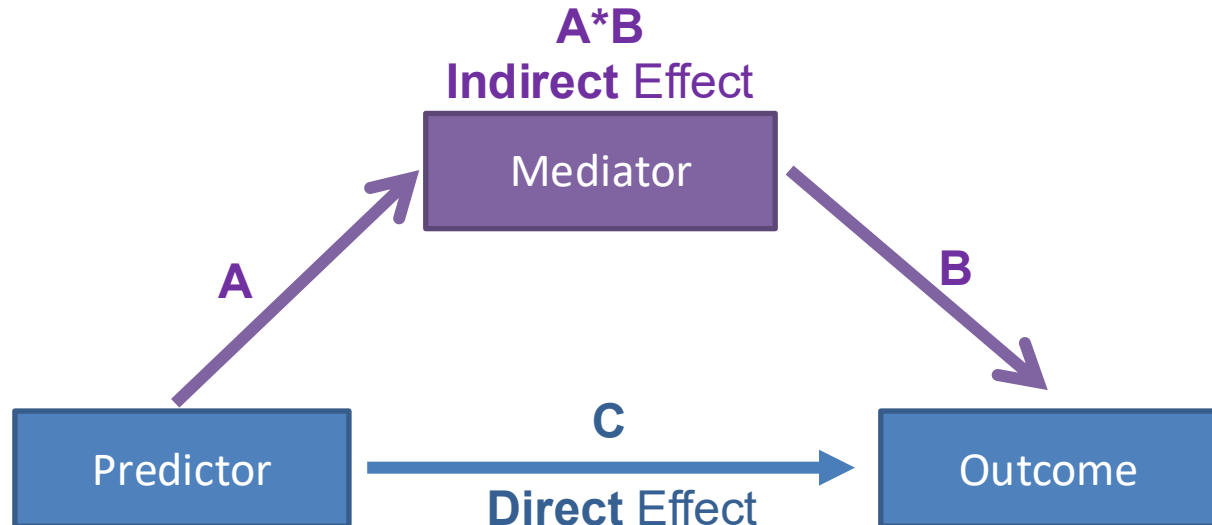

- A mediating variable is one that can be used to represent the *hidden underlying cause* of a relationship between an independent and dependent variable
- A mediator variable *explains why* a relationship exists as it provides a *reason* for the effect of a given factor upon an outcome of interest
- Most analysts regard a **mediator** as something that the independent variables **causes**. The mediator variable then goes on to influence the dependent variable.
- Examples:
 - A new exercise regime may be related to an increase in self-esteem. Is this relationship mediated by the degree of weight loss that exercise regime causes which in turn increases self-esteem?
 - A researcher discovers that income is related to life expectancy. Is this relationship mediated by the assumption that those with higher incomes spend more on healthcare?

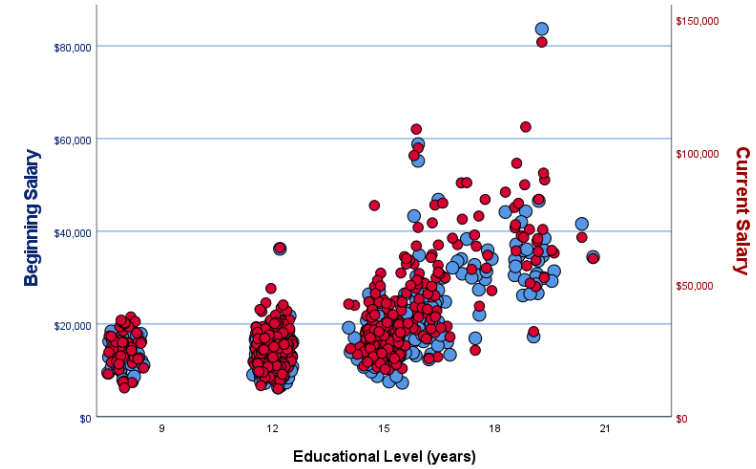

Mediation Analysis - Graphical Form

No Mediator

Mediator included

Our example

Mediation Analysis

- Is the relationship between **education level** and **current salary** mediated by **starting salary**?
- A person's starting salary is likely to be directly related to their education level
- Therefore, the relationship between education, starting salary and current salary might look something like:

Education > Starting Salary > Current Salary

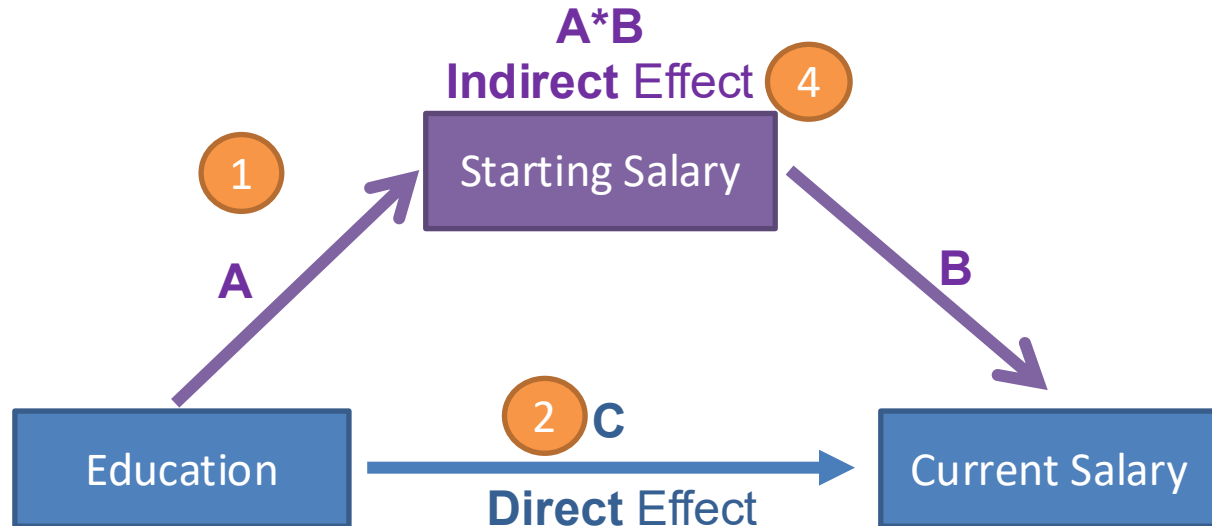

- If so, it is reasonable to assume that starting salary *may* **mediate** the relationship between education and current salary

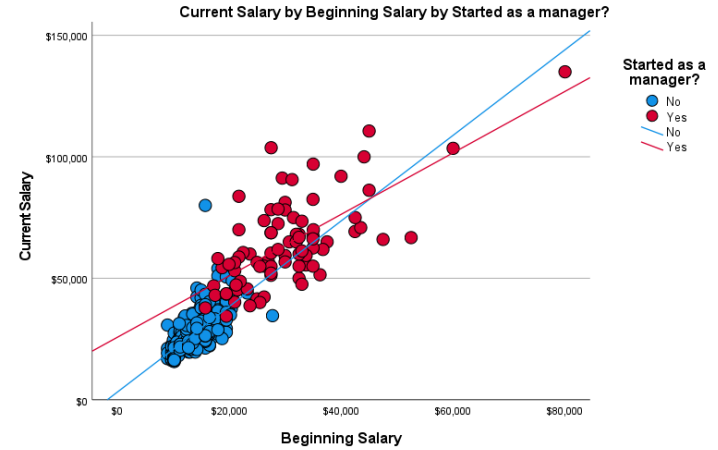

Mediation Analysis - Graphical Form

No Mediator

Mediator included

Let's take a look...

Path A – education predicts *starting* salary

OUTCOME VARIABLE:

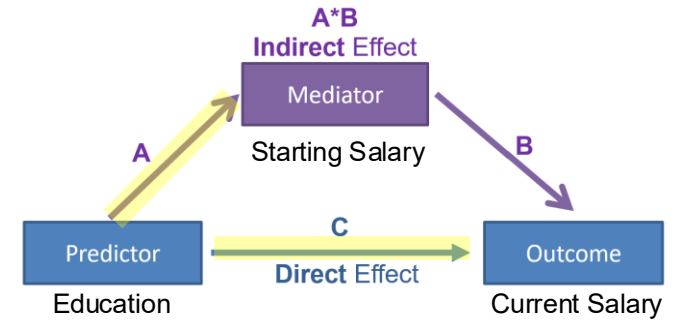

salbegin

Model Summary

Introduction to Mediation, Moderation, and Conditional Process Analysis: A Regression-Based Approach Third Edition

Introduction to Mediation, Moderation, and Conditional Process Analysis describes the foundation of mediation and moderation analysis as well as their analytical integration in the form of "conditional process analysis", with a focus on **PROCESS** for SPSS SAS, and R (**#processmacro**) as the tool for implementing the methods discussed. Available as both an e-book and in print form, it is published by The **Guilford Press**.

Here are the **data files** and **code** used in this third edition of the book.

Here is the **errata** for the third edition.

CONVERSATIONS

- ▼ How can I remove unwanted LOG output?
 - How can I remove unwanted LOG output
 - Whats the difference between ANOVA and ANCOVA

To remove unwanted LOG output in IBM SPSS Statistics, you can hide the log messages in the Viewer. Here's how to do it:

1. From the menus, choose:
 Edit > Options...
2. Click the **Viewer** tab.
3. Double-click the **Log** icon to hide log messages in the output.
4. Click **OK** to save your changes and close the dialog box.

This will hide the log output from the Viewer, helping to declutter your output display.

Whats the difference between ANOVA and ANCOVA?

Difference Between ANOVA and ANCOVA

ANOVA (Analysis of Variance) and ANCOVA (Analysis of Covariance) are both statistical methods used to compare the means of different groups. However, they differ in their approach and application:

- **ANOVA:** This method is used to compare the means of three or more groups to see if there are any statistically significant differences between them. It does not take into account any other variables that might influence the dependent variable.
- **ANCOVA:** This method is an extension of ANOVA that includes one or more continuous independent variables, known as covariates. ANCOVA adjusts the means of the groups based on the covariates, which can help reduce the error variance and increase the power of the test.

In summary, ANCOVA is used when you want to control for the effects of one or more continuous variables (covariates) while comparing the means of different groups, whereas ANOVA is used when you only want to compare the means without considering any other variables.

For more detailed information, please consult external sources or the official SPSS documentation.

Frequently asked questions

[ChatSPSS – AI-Powered SPSS Tutor](#)

Meet ChatSPSS – Your AI-Powered SPSS Tutor

Get instant, accurate answers to your SPSS and statistics questions – anytime you need them.

Smart Vision Europe is proud to introduce **ChatSPSS**, the first AI-enabled tutor designed specifically for SPSS users. Whether you're new to SPSS or an experienced analyst, ChatSPSS helps you get the very most out of your software, saving you time and boosting your confidence with data analysis.

What can ChatSPSS do for you?

- ✓ Guide you through loading and preparing data in SPSS
- ✓ Show you how to summarise results and run statistical tests
- ✓ Explain outputs from regression models and other advanced techniques
- ✓ Answer almost any SPSS or statistics-related question, on demand

Smart Vision Europe: Services and Expertise

We have decades of experience providing guidance, training and consultancy in the delivery of effective data science initiatives.

Smart Vision Europe: Other services

- **Sourcing Software**
 - You can buy your analytical software from us often with discounts
 - Assist with selection, pilot, implementation & support of analytical tools
 - <http://www.sv-europe.com/buy-spss-online/>
- **Training**
 - Formal classroom/virtual training
 - Online self-paced training resources
- **Advice and Support**
 - ‘No strings attached’ technical and business advice relating to analytics
 - Tracked technical support services around the IBM SPSS product line
